Mobile Card Reader

Flexible, secure data transfer for drivers

The VDO Mobile Card Reader is – in conjunction with the Downloadkey II and the TIS-Compact II Key – the ideal device which drivers on the road can use to download digital driver card data. And it doesn't require user authentication via a company card.

This enables fleet managers to access driver card data at all times and download this information in accordance with legal requirements without issuing company cards to the drivers themselves.
The Mobile Card Reader is also compatible with the Downloadkey II and TIS-Compact II Key downloading and archiving solutions.

The mobile reader excels above all due to its secure, user-friendly operation: The data transfer starts auto-matically once the driver card and one of the keys are inserted into the device.

The Mobile Card Reader is operated via a serial 6-pin interface with the Downloadkey II or the TIS-Compact II Key and is ready to use anytime, because aside from obtaining power through a power cord, the device can also be operated using the four batteries supplied with it.

VDO
